

Manitoba has the highest rate of HIV in Canada

Here's how you can help

Offer pre-exposure prophylaxis (PrEP) to patients in your care

Recommend HIV testing every 3-6 months if your patient is having condomless sex with new, anonymous or multiple partners OR is a person who injects drugs

When testing for one STBBI, test for all

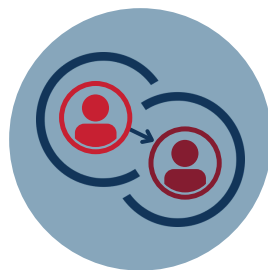

Understand the historic and current context of HIV in Indigenous Peoples, and increase your knowledge of culturally safe care

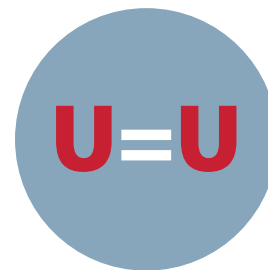

If your patient's test is positive for HIV

Notify your patient as soon as possible after diagnosis

Refer your patient using the Manitoba HIV Program Referral Form

Reinforce that when HIV is undetectable, it is sexually untransmittable (U=U)

Conduct a baseline medical assessment

Caring for a patient who is not connecting for HIV care or have urgent clinical concerns?
